

Solid Step Cote for Boat Docks & Decks

Recommended Formulation: 04

Marine and Boating have their own set of special requirements when it comes to non slip surfaces. Many boats feature surfaces that are particularly difficult to deal with when it comes to creating a non slip surface. Fiberglass, teak and other wood and plastics need a coating that is durable, provides a high coefficient of friction when wet, and can handle intensive UV exposure and constant exposure to salt or fresh water.

Solid Step Cote is the only anti slip solution on the market that fits this bill making it the best fit for boats, yachts, cruise ships and other marine vessels. Furthermore, because **Solid Step Cote** is a water-based, Green, non-toxic product, there are no concerns with wash-off or excess that may get into the water when applying it.

Solid Step Cote is a single component, slip resistant solution that is easy to apply (no mixing required) and maintain and can handle the elements associated with boating and the marine environment. Why continue to use inconvenient and unsightly sandpaper strips that are expensive, peel off and leave sticky residue, and don't last, or epoxy coatings that are highly toxic and dangerous as well as difficult to apply with unreasonable drying times? Just roll or spray on two coats of **Solid Step Cote** that will dry within 4-6 hours of application and you're good to go. And our non slip solution should last for several years on your fiberglass or teak decks, depending upon the amount of foot traffic it receives.

Plus, with its built in UV protection and Mildewcides, **Solid Step Cote** is a sealer that will protect the underlying surface and keep your boat's surface from yellowing, discoloring or developing mold or mildew.

Get **Solid Step Cote** now and create the green, clean and effective non slip surface you're seeking today!
